ABSTRACT

Smart Recipe is a recipe recommendation system that helps users prepare meals using the ingredients already available at home. Many people spend a lot of time searching for recipes or avoid cooking because they are missing one or two ingredients. This project solves that problem by allowing users to enter the ingredients they have and displaying recipes that match them. If some ingredients are unavailable, the system also suggests suitable alternatives. The project aims to reduce food waste, save time, and make cooking more convenient. It uses basic Data Structures and Algorithms such as arrays, hash maps, searching, and sorting to store recipe information and find relevant recipes efficiently. The system is simple, user-friendly, and can be useful for students, families, and anyone who wants quick meal suggestions based on the ingredients available at home.
